

The ultra low noise 24-bit ADC: AD7190

[see also Quad Delta-Sigma Board](#)

Test measurements on a strain gauge load cell

The laodcell was connected with a 6-wire configuration to the evaluation board of the AD7190. The samplerate was set to 10 S/s, chopping enabled (continuous offset and gain correction). The analog 5V supply was powered from the RIGOL DP832, which has a very low noise level.

We measured an astonishing low noise level of about 50nV(rms).

Spectrum at 600 S/s

Noise level with shorted inputs

Spectrum with connected loud speaker

Spectrum when singing a "Uuuuu..."

Here we evaluated the possibility to use a loudspeaker as a low-frequency microphone. Due to lack of shielding of electromagnetic fields, the coil picks up a huge amount of signals, which are not related to acoustic sound waves.

Arduino Firmware for Arduino DUE
