Siglent SDM3065x Bench Multimeter

SCPI and Fast Sampling

This bench multimeter needs a very special procedure, to get the advantage of fast measurements.

This article should be applicable with minor adjustments for the all the new Siglent DMM's: SDM3045X, SDM3055, SDM3055A, SDM3065X

Problem

The default command `Measure:Voltage:DC?` takes about 2s. What next came to mind, was the command `Read?`. It answers very fast, but is delivers measurements from the past - could be some minutes or even hours old. Even clearing the buffer with R? doesn't change that situation.

Another Problem is, that when the DMM got it's first `Measure` command, the display will not update any more, also mentioned by a user in the EEVblog Forum, see Links [2].

Solution

For both problems I gladly found the solution. The approach is like this:

- set the sampling counter to MAX (600 Mio)
- clear the buffer with R? (to avoid getting an old value on the first reading)
- set trigger source to 'BUS'
- initiate the DMM (arms the trigger)
- trigger it by sending *TRG
- read samples with R? 1

When the DMM isn't asked for any value, it will sample with the preset NPLC setting (200ms by default) and therefore also updates the LCD reading.
If we want the latest value from the memory, we query for it with R? 1.

Python Code

Below you can find a python class for communicating with it. It implements the upper approach.

A typical usage could be:

```
import siglent_sdm3065x
dmm = siglent_sdm3065x.SDM3065X('10.0.0.114')
dmm.reset()

# setup:
v = dmm.getVoltageDC('20V',0.05) # set NPLC to 0.05 which is 1ms in a 50Hz grid
print(v)

# further readings:
for i in range(10):
    print(dmm.read())
```

siglent_sdm3065x.py

```
# Python3 Class for controlling a Siglent SDM3065x Bench Multimeter via Ethernet and SCPI
